## Light up Shadow Box Cricut Guide

These templates vary in their complexity and some would be very difficult to cut by hand, so a cutting machine would be required to complete the project, a machine such as a Silhouette Cameo or a Cricut machine will work well with these templates.

### Step 1: Pick Your Project

Select which project you are going to create, download from the source and unzip the files to see the various layers and other information.

You will see PDF / PNG / SVG files and depending on how you plan on cutting the files you will need to use the most suitable file type to either print for hand cutting or upload to cutting machine.

SVGs are best for Silhouette and Cricut machines.

Some machine use PNGs.

And PDFs are best for hand cutting.

### Step 2: Materials

Source the required materials and equipment to create your project, at a minimum you will need the following.

- Cutting matt
- Craft scissors
- Craft knife (sharp one)
- Tweezers
- 5mm double sided tape
- 5mm foam board
- Card stock 12x12 inch (30.5x30.5cm) 180 to 220gsm
- Steel rule
- LED strip, self-adhesive, 1 meter long, 30 bulbs per meter
- Chameleon markers for colouring LED bulbs

### **Step 3: Choose The Correct Shadow Box Frame For Your Project**

Pending on the size of the project you will need to choose a shadow box frame suitable to take the dept of the overall project layers and the LED lighting.

Typically a frame with an insert opening of 30mm will fit most projects depending on the number of layers.

Of course if you want to make a much deeper shadow box then you may require a much deeper insert space.

We offer card stock shadow box frames of different sizes on our Etsy shop page, these can be ideal to start with as you can use the same card stock as your project to create a suitable box frame and test your finished project to see how it looks.

We don't often use the more expensive wooden or plastic frames as the effect with our card stock frames is very good.

### **Step 4: Cut Out The Various Layers**

So now you are ready to start cutting out your layers. It is important to ensure the layer size is the correct size for your chosen shadow box frame, too big and it will not fit, or too small and you will see too much of the boarders.

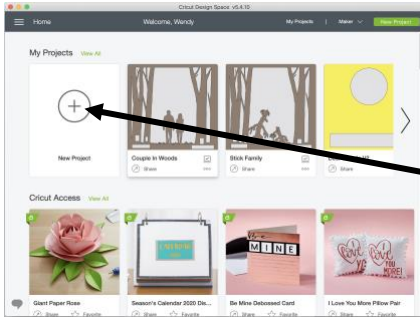

We generally cover the back board of the frame with white paper / card to help reflect the LED light through the shadow box, use strips of double sided tape to attach the paper or card. In this example we are cutting 8.054 by 8.054 inches.

You can find online tutorials for Cricut Design Space software follow the link below.

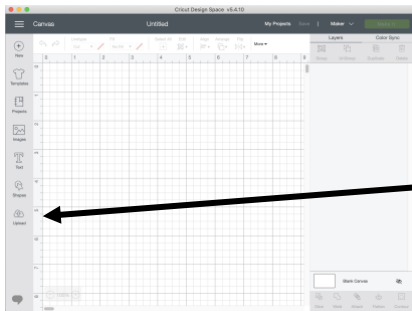

<https://learn.cricut.com/design-space%C2%AE/design-space-beginners/design-space-tutorials-beginners-playlist>

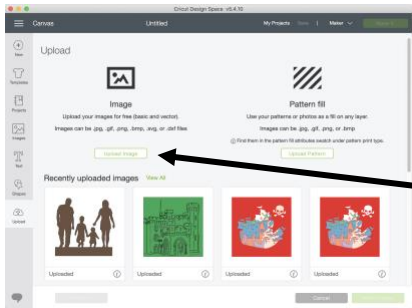

Open Cricut Design Space on your computer

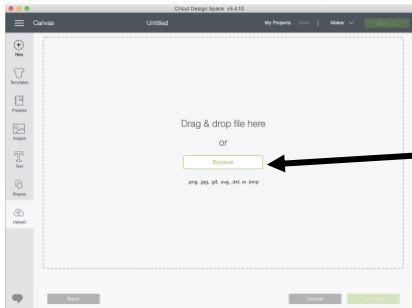

Select New Project

Select Upload

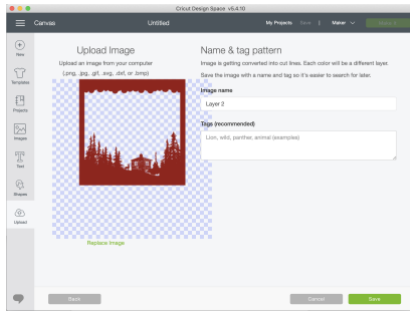

Select Upload Image

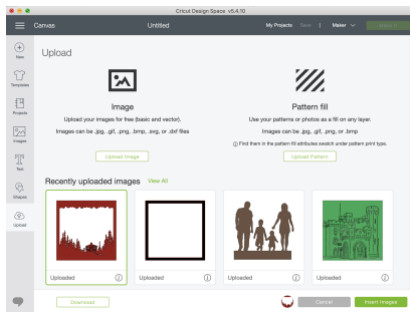

Select Browse

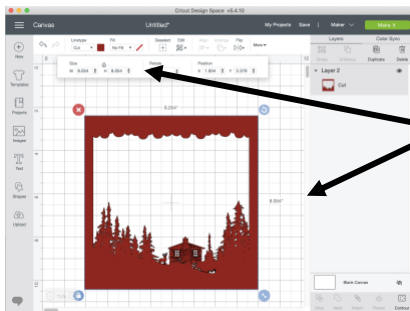

Select the SVG file you want to cut and select Open

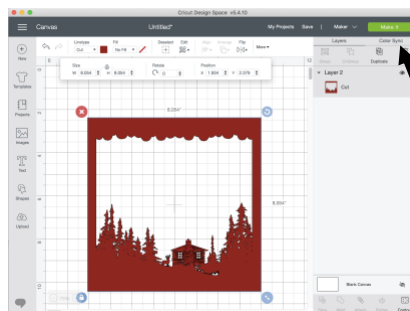

Check you have the required image and click on Save

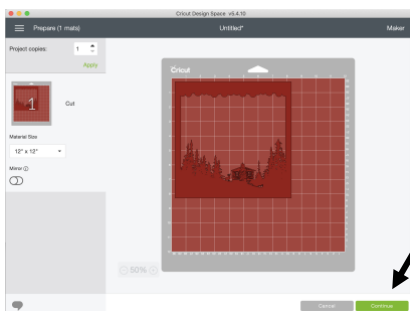

Highlight your project image and click on Insert Image

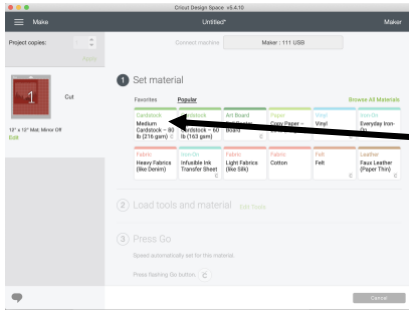

Change the size of the image to suit your frame size, this example is 8.054 by 8.054 inches

Click on Make It

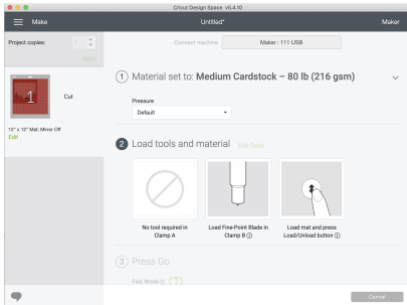

Check the positioning of the image on the cutting matt  
Then click on Continue. Make sure your Cricut is connected to your computer and turned on.

Select your cutting material

Setup you cutting material on you cutting matt.

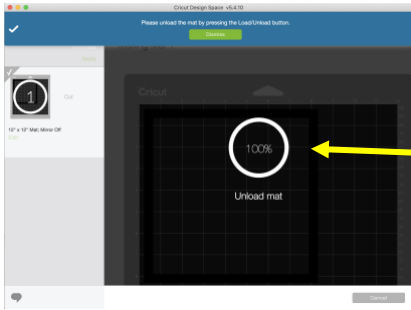

Follow the on screen instructions

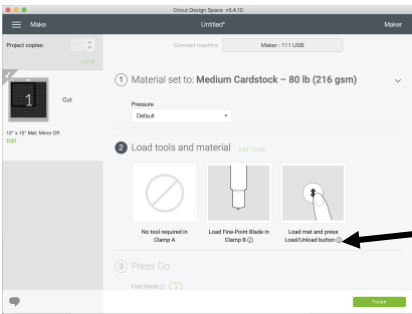

Load the cutting matt by pressing the arrow button

Start cutting by pressing the Cricut button

Cutting progress will be displayed on your computer screen

Unload the finished cut by pressing the arrow button

You are done, one layer cut, now follow the above instructions to cut the rest of the layers for you project.

### **Step 5: Creating the Foam Board Strips**

Firstly you will need a steel ruler or similar, a craft knife and a pencil.

For a 9x9 inch project you will need foam board lengths of 180mm, each 5mm wide, four strips for between each layer.

Mark your foam board with a ruler and pencil at 180mm and 5mm and cut strips with the craft knife using the edge of the steel rule as a guide. Caution this is not an easy task and if not careful you could easily give yourself a nasty cut, be careful.

### **Step 6: Applying Double Side Tape to the Foam Strips**

Take each strip and apply a strip of double sided tape to one side. Keep the tape centred on the strip of foam board where possible.

Depending on the frame you have chosen you might need double sided tape on the foam board strips you use for mounting the LED lights, this generally applies to the card stock frames as this type of frame is assembled from back to front, whereas shop bought frames are assembled from front to back.

### **Step 7: Mounting the Foam Board Strips to the Layers**

Layer 1, the front layer does not require foam board.

Layer 2 should have four strips of foam board attached to the front facing edges of the layer with the double sided tape you attached to the foam board earlier.

Further layers should have four strips attached to the front facing edge as per layer 2.

### **Step 8:       Setting Up The LED Lights**

Firstly you need to attach the LED light strip to foam board strips, use the adhesive backing on the LED strip to attach, or use double sided tape if required. Make sure you space the LED lights with a suitable gap between each foam strip to fit them around the inside of your chosen shadow box frame.

Next line up the lights in the frame to ensure all fits well and workout where the cable for the lights will come out of the frame and create a pathway, ensure that when the frame is fully assembled that the cable is not pinched / damaged by the frame.

### **Step 9:       Colouring The Lights**

For your project you can set the colour of the LED bulbs by colouring them with the likes of Chameleon markers, we find the Chameleon markers work the best.

Decide what colour effect you would like and colour each bulb to create light effects that suit your project.

We find the most suitable colours are as follows.

- PR4 Purple Grape
- BV4 Blue Violet
- RD4 Crimson Red
- GR3 Grass Green
- CB Colourless Blender (this is used to lighten the colours or even to clean the colour off a bulb if it is incorrect)

### Step 10: Assembling The Finished Project

No you are ready to assemble the project.

Firstly check all layers will fit the chosen frame.

Next check you have all the layers in the correct order.

Then one by one assemble the layers in the frame, attach the front or back of the frame, turn on the lights and enjoy.

**Step 11: Send Us a Photo**

We love to see what our customer have created and to get feedback of what they like and what they would like improved or even new ideas for creations, so don't be shy.
